                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a clone of wheat starch branching enzyme II (SBEII), which is part of a novel subclass of known SBEII genes, designated SBEII-1. The specification also describes subclass SBEII-2 sequences. The SBEII-1 genes are thought to have similar functional properties to the maize SBEIIb gene. Starch branching enzymes catalyse the formation of the alpha-1,6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1,4 linkage followed by reattachment of the released alpha-1,4-glucan chain to the same or another glucosyl chain. SBEII polypeptides can be used to alter the characteristics of a plant, in particular to alter starch so that it has an elevated gelathisation onset and/or peak temperature. Starch obtained from transgenic plants is useful in the preparation or processing a foodstuff, particularly bakery products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA encoding wheat starch branching enzyme II isoforms, useful in altering the characteristics of a plant, especially elevated stargelatinization onset and/or peak temperature.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       09-SEP-1999;

                                                                                                                    The present sequence represents a clone of wheat starch branching enzyme II (SBEII), which is part of a novel subclass of known SBEII genes, designated SBEII-1. The specification also describes subclass SBEII-2 sequences. The SBEII-1 genes are thought to have similar functional properties to the maize SBEIIb gene. Starch branching enzymes catalyse the formation of the alpha-1,6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1,4 linkage followed by reattachment of the released alpha-1,4-glucan chain to the same or another glucosyl chain. SBEII polypeptides can be used to alter the characteristics of a plant, in particular to alter starch so that it has an elevated gelatinisation onset and/or peak temporature. Starch obtained from transgenic plants is useful in the preparation or processing a foodstuff, particularly bakery products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             gelatinisation
                                                                                                                                                                                                                                                                                                                      Disclosure; Page 168-169; 197pp; English.

The present sequence represents the consensus sequence of wheat starch branching enzyme II (SBEII). The specification describes novel subclasses of SBEII, designated SBEII-1 and SBEII-2. The SBEII-1 genes are thought to have similar functional properties to the maize SBEIIb gene. Starch branching enzymes catalyse the formation of the alpha-1, 6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1,4 linkage followed by reattachment of the released alpha-1,4 glucan chain to the same or another glucosyl chain. SBEII polypeptides can be used to alter the characteristics of a plant, in particular to alter starch so that it has an elevated gelatinisation onset and/or peak temperature. Starch obtained from transgenic plants is useful in the
                                                                                                                                                                                                                  DNA encoding wheat starch branching enzyme II isoforms, useful in altering the characteristics of a plant, especially elevated starch
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Wheat; starch branching enzyme II; SBEII; SBEII-1; starch; SBEII-2 gelatinisation onset; transgenic plant; foodstuff; bakery product;

The SBEII-1 genes are thought to have similar functional properties to the maize SBEIIb gene. Starch branching enzymes catalyse the formation of the alpha -1,6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1,4 linkage followed by reattachment of the released alpha-1,4-glucan chain to the same or another glucosyl chain. SBEII polypeptides can be used to alter the characteristics of a plant, in particular to alter starch so that it has an elevated gelatinisation onset and/or peak temperature. Starch obtained from transgenic plants is useful in the preparation or processing a foodstuff, particularly bakery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding wheat starch branching enzyme II isoforms, useful in altering the characteristics of a plant, especially elevated starch gelatinization onset and/or peak temperature.

This invention, in the area of plant biotechnology, relates to novel CC polynucleotides comprising a nucleotide sequence encoding a protein which CC is involved in or associated with the synthesis, metabolism or CC degradation of carbohydrates in the plant grain and the expression of CC which is up-regulated during grain filling. The plant is selected from CC corn, tomato, banana, canola, cotton, peanut, sorghum, tobacco, CC sugarbeet, wheat, and rice. The invention may be useful for the CC improvement of protein, oil, starch, fibre and moisture content of the CC cereal grains. In addition, carbohydrate levels may be modified to a more CC desirable level using the present invention. The present sequence is a CC DNA sequence encoding a rice protein of the invention. Note: The sequence CC data for this patent did not form part of the printed specification, but CC was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New plant genes encoding polypeptides having an activity involved in or associated with the synthesis, metabolism or degradation of carbohydrates in the plant grain useful in generating plants having improved nutritional properties.
                                                                                                       Wheat; starch l gelatinisation
                                                                                                                                                                                     Nucleotide sequence of starch branching enzyme II clone B10.
                                                                                                                                                                                                                                                                                                                                                            AAZ99941 standard; DNA; 1120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a clone of wheat starch branching enzyme II (SBEII), which is part of a novel subclass of known SBEII genes, designated SBEII-1, subclass B. The specification also describes subclass SBEII-2 sequences. The SBEII-1 genes are thought to have similar functional properties to the maize SBEII genes. Starch branching enzymes catalyse the formation of the alpha-1, 6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1, 4 linkage followed by reattachment of the released alpha-1,4-glucan chain to the same or another glucosyl chain. SBEII polygeptides can be used to alter the characteristics of a plant, in particular to alter starch so that it has an elevated gelatinisation onset and/or peak temperature. Starch obtained from transgenic plants is useful in the preparation or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA encoding wheat starch branching enzyme II isoforms, useful in altering the characteristics of a plant, especially elevated starch gelatinization onset and/or peak temperature.

The specification also describes subclass SBEII-2 sequences. The SBEII-1 genes are thought to have similar functional properties to the maize SBEIIb gene. Starch branching enzymes catalyse the formation of the alpha-1,6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1,4 linkage followed by reattachment of the released alpha-1,4-glucan chain to the same or another glucosyl chain. SBEII polypeptides can be used to alter the characteristics of a plant, in particularly backery products processing a foodstuff, particularly bakery products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA encoding wheat starch branching enzyme II isoforms, useful in altering the characteristics of a plant, especially elevated starch gelatinization onset and/or peak temperature.

                                                                                                                                                                                                                                                                                                                                                             RESULT 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention, in the area of plant biotechnology, relates to novel CC polynucleotides comprising a nucleotide sequence encoding a protein which CC is involved in or associated with the synthesis, metabolism or CC degradation of carbohydrates in the plant grain and the expression of CC which is up-regulated during grain filling. The plant is selected from CC corn, tomato, banana, canola, cotton, peanut, sorghum, tobacco, CC sugarbeet, wheat, and rice. The invention may be useful for the CC improvement of protein, oil, starch, fibre and moisture content of the CC cereal grains. In addition, carbohydrate levels may be modified to a more desirable level using the present invention. The present sequence is a CDNA sequence encoding a rice protein of the invention. Note: The sequence CC data for this patent did not form part of the printed specification, but C was obtained in electronic format directly from WIPO at CF, wipo.int/pub/publishedpct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                  The present invention relates to a method (MI) for identifying genes involved in plant resistance or response to pathogenic infection. MI comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (MI) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying at least one gene involved in plant resistance or response pathogenic infection for conferring resistance or tolerance to a plant bacterial, fungal or viral infection by determining or detecting plant
                                                                                                                                                                                                                                                                      Sequence 2655 BP; 714 A; 529 C; 680 G;

GENERAL INFORMATION:

APPLICANT: Willmitzer, et al.

APPLICANT: Willmitzer, et al.

TITLE OF INVENTION: NUCLEOTIDE SEQUENCES ENCODING ENZYMES THAT ALTER THE CARBOHYDRATE

TITLE OF INVENTION: CONCENTRATION AND COMPOSITION IN PLANTS

FILE REFERENCE: 514413-3515.1

CURRENT APPLICATION NUMBER: US/09/609,040

CURRENT APPLICATION NUMBER: PCT/EP92/00302

PRIOR APPLICATION NUMBER: PCT/EP92/00302

PRIOR FILING DATE: 1992-02-11

NUMBER OF SEQ ID NOS: 4

SOFTWARE: Patentin version 3.0

SEQ ID NO 1

LENGTH: 2909

TYPE: DNA
ORGANISM: Solanum tuberosum

PEATURE:
NAME/KEY: CDS
LOCATION: (2)...(1699)

COTHER INFORMATION: BRANCHING ENZYME

Sequence 872, Application US/09938842A

Patent No. US200320160378A1

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Harper, Jeff
APPLICANT: Kreps, Joel
APPLICANT: Wang, Xun
APPLICANT: Zhu, Tong
ITILE OF INVENTION: STRESS-REGULATED GENES OF PLANTS, TRANSGENIC PLANTS CONTAINING
ITILE OF INVENTION: SAME, AND METHODS OF USE
FILE REFERENCE: SCRIP1300-3

CURRENT APPLICATION NUMBER: US/09/938,842A

CURRENT FILING DATE: 2001-08-24
PRIOR APPLICATION NUMBER: US 60/227,866
PRIOR APPLICATION NUMBER: US 60/27,866
PRIOR APPLICATION NUMBER: US 60/264,647

PRIOR FILING DATE: 2001-06-22

NUMBER: US 60/300,111

PRIOR FILING DATE: 2001-06-22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FILE REFERENCE: 2024 (PARA-013PRV)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence:
Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         nucleic search, using sw model

/note="Vector: pCMV.SPORT6; Crown and developmental stages

/of spike formation in wheat cultivar Norstar. 4 mRNA

/opulations were coultivar loss constructing the library.

The first mRNA population is from lcm crown sections after 1 days of deacclimation (before

leacclimation plants were fully vernalized for 49 days).

The third is from different developmental stages of spike

formation (5 to 50mm) that still have not emerged from the

leaf (dissection required). The last is from different

developmental stages of spike and seed formation after

having emerged from the leaf (visible). First strand

synthesis in this library was done in the presence of

methylated dCTP thereby protecting from internal cleavage

with Noti."
